Fortiwan Dashboards V1

2024-02-19

This standalone release of "**Fortiwan Dashboards**" effectively renders each network and its vitals as GET data.

Each network, if available, offers a WAN switch, which PUT between the two providers present.

These fully internet-driven WAN interfaces equip technicians with the necessary tools to monitor and respond to sites going down by switching the interface to the alternating provider

Suite Feature List

1. **Alternating WAN Interface.** Endpoints are hit with a PUT action which contains instructions to change the interface's provider. Useful for when one provider is offline. [FAST-STABLE](#)
2. **Direct-Support** where technicians lookup a specific serial number - **providing real-time support directly to the searched for site.** [STABLE](#)
3. **All Sites** and **Unavailable Sites** are featured buttons that will load sites, respectively. (Both are now functional from V1.2)
4. Bearer Token(APIUser objects) are dynamically handled based on a timed expiration of the token. **Refresher are used to refresh the Bearer Token.** [VULNERABLE](#)
5. **Thread executed** api requests are pooled together and bulked data is retrieved. The data is deconstructed into dynamic and interactive panes describing a site connected or disconnected from the network. [FAST-STABLE](#)
6. **End-to-end** retrieval of critical IPsec VPN Tunnel data in real-time. [STABLE](#)

Suite Compatibility Statement

All features that have been released within this suit is entirely dynamic, and adjusts certain properties to align with user screen size. The suit is built with a responsive design and leverages the well-known Bootstrap 5 Column and Grid technology to achieve this.

- Mobile Device Tested: **No(required)**
- Desktop & Laptop Device Tested: **Yes**
- Feedback: **10/10**
